THE FOURIER SPECTRAL APPROXIMATION FOR KOLMOGOROV-SPiegel-SIVASHINSKY EQUATION

XIAOPENG ZHAO, BO LIU, AND PENG ZHANG

Received 28 June, 2012

Abstract. In this paper, we consider the Fourier spectral approximation for numerically solving the Kolmogorov-Spiegel-Sivashinsky equation. The semi-discrete and fully discrete schemes are established. Moreover, the existence, uniqueness and the optimal error bound are also considered.

2010 Mathematics Subject Classification: 65M12; 65M70
Keywords: Kolmogorov-Spiegel-Sivashinsky equation, Fourier spectral approximation, existence, uniqueness, optimal error bound

1. INTRODUCTION

In this paper, we study the initial-boundary value problem for the Kolmogorov-Spiegel-Sivashinsky (KSS) equation

\[ u_t + ku_{xxxx} + \beta u + \gamma u_x^2 + \alpha u_{xx} - \delta (u_x^2)_x = 0, \quad (x,t) \in Q_T, \]

\[ u_x(0,t) = u_x(1,t) = u_{xxx}(0,t) = u_{xxx}(1,t) = 0, \]

\[ u(x,0) = u_0(x), \quad x \in (0,1). \]  

(1.1a) (1.1b) (1.1c)

where \( Q_T = (0,1) \times (0, T) \), \( k, \alpha, \beta, \gamma \) and \( \delta \) are positive parameters.

Equation (1a), which was derived by Sivashinsky [10], is a fourth-order nonlinear parabolic equation, which models the effective negative viscosity in a certain direction \( x \) of a large-scale flow. It is easy to check that if \( \beta = 0 \) and \( \delta = 0 \), the equation (1a) is the classical Kuramoto-Sivashinsky equation (see [1, 7, 9, 11, 15]).

In [8], Nicolaenko presents mathematical and computational investigations of the finite dimensional behavior of the solutions for the above equation, and points out the existence of the global attractor and inertial manifold for the equation.

In [13], by discarding the linear damping term, Unal and Suhubi obtained the KSS model’s periodic, quasi-periodic and solitary wave solutions analytically to a certain degree of approximation. Melnikov analysis had also been carried out to identify...
the homoclinic bifurcation. Transient spatiotemporal chaos had been observed. Ünal and Suhubi[12] also studied the group invariant solutions to the KSS equation. And a local analysis of the dynamical system obtained by the group theoretical means were performed by employing normal form analysis.

Recently, Guo and Wang[5] made a simple transform for the equation (1a). Differentiating the equation with respect to $x$ and setting $u_x = v$, they obtained

$$v_t + kv_{xxxx} + \beta v + \gamma (v^2)_x + \alpha v_{xx} - \delta (v^3)_{xx} = f(x).$$ (1.2)

Therefore it is interesting to study the periodic BVP of (1.2) in multidimensional version. The authors first established the existence and uniqueness of the global solution, and then showed the existence of the global attractor, which has finite Hausdorff and fractal dimensions. Finally, they derived the Gevrey class regularity for the equation and constructed approximate inertial manifolds.

Fourier spectral approximations are essentially discretization methods for the approximate solution of partial differential equations. They have the natural advantage in keeping the physical properties of primitive problems. During the past years, many papers have already been published to study Fourier spectral method, for example [3, 6, 16, 17].

In this paper, we consider the Fourier spectral method for Kolmogorov-Spiegel-Sivashinsky equation (1a) with Neumann boundary condition (1b) and the initial condition (1c). Based on Sobolev’s embedding theorem and some important inequalities, we obtain the error result $O((\Delta t)^2 + N^{-s})$ ($s = 2$). Noticing that the existence of a solution locally in time is proved by the standard Picard iteration, global existence results are obtained by proving a priori estimates for the appropriate norms of $u(x,t)$. Adjusted to our needs, similar to the proof in [4, 18], the following results on global existence and uniqueness of solution to problem (1)-(3) are given in the following form:

**Theorem 1.** Assume that $u_0 \in H^2_E(0,1) = \{ w; w \in H^2, w_x(0,t) = w_x(1,t) = 0 \}$. Then there exists a unique global solution $u(x,t)$ such that

$$u(x,t) \in L^\infty(0,T; H^2_E(0,1)) \cap L^2(0,T; H^4(0,1)).$$

This paper is organized as follows. In the next section, we consider a semi-discrete Fourier spectral approximation, prove its existence and uniqueness of the numerical solution and derive the error bound. In Section 3, we consider the full-discrete approximation for problem (1). Furthermore, we prove convergence to the solution of the associated continuous problem. In Section 4, some numerical experiments which confirm our results are performed. In the last section, conclusions are given.

Throughout this paper, we denote the $L^2$, $L^p$, $L^\infty$, $H^k$ norms in $(0,1)$ simply by $\| \cdot \|$, $\| \cdot \|_p$, $\| \cdot \|_\infty$ and $\| \cdot \|_{H^k}$. 
2. SEMI-DISCRETE APPROXIMATION

In this section, we consider the semi-discrete approximation for problem (1). First of all, we recall some basic results on the Fourier spectral method which will be used throughout this paper. For any integer \( N > 0 \), we introduce the finite dimensional subspace of \( H^2_E(0, 1) \):

\[
S_N = \text{span}\{\cos k\pi x; k = 0, 1, \ldots, N\}.
\]

Let \( P_N : L^2(0, 1) \rightarrow S_N \) be an orthogonal projecting operator which satisfies:

\[
(u - P_N u, v) = 0, \quad \forall v \in S_N. \tag{2.1}
\]

For the operator \( P_N \), we have the following result (see [2, 16]):

(B1) \( P_N \) commutes with derivation on \( H^2_E(0, 1) \), i.e.,

\[
P_N u_{xx} = (P_N u)_{xx}, \quad \forall u \in H^2_E(0, 1).
\]

Using the same method as previous papers [2, 14], we can obtain the following result (B2) for problem (1):

(B2) For any real \( 0 \leq \mu \leq 2 \), there is a constant \( c \), such that

\[
\|u - P_N u\|_\mu \leq c N^{\mu - 2} \|u_{xx}\|, \quad \forall u \in H^2_E(0, 1).
\]

We define the Fourier spectral approximation for problem (1): Find \( u_N(t) = \sum_{j=1}^{N} a_j(t) \cos j\pi x \in S_N \) such that

\[
\begin{align*}
\frac{\partial u_N}{\partial t} - \alpha(u_N, v_N) + k(u_{Nxx}, v_N) + \beta(u_N, v_N) + \gamma(u_{Nx}, v_N) &- \delta(u_{Nxx}, v_N) = 0, \\
\forall v_N &\in S_N.
\end{align*} \tag{2.2}
\]

for all \( T \geq 0 \) with \( u_N(0) = P_N u_0 \).

Now, we are going to establish the existence and uniqueness of the Fourier spectral approximation solution \( u_N(t) \) for all \( T \geq 0 \).

**Lemma 1.** Let \( u_0 \in H^2_E(0, 1) \), then (2.2) has a unique solution \( u_N(t) \) satisfying the following inequalities:

\[
\|u_N(t)\|_{H^2_E}^2 \leq c_1 \|u_0\|_{H^2_E}^2, \quad \int_0^T \|u_N(t)\|_{H^2_E}^2 dt \leq c_1' \|u_0\|_{H^2_E}^2, \tag{2.3}
\]

where \( c_1 \) and \( c_1' \) are positive constants depend only on \( \alpha, \beta, \gamma, \delta, T \) and \( \|u_0\|_{H^2_E} \), independents of \( N \).

**Proof.** Set \( v_N = \cos j\pi x \) in (2.2) for each \( j \) (\( 1 \leq j \leq N \)) to obtain

\[
\frac{d}{dt} a_j(t) = f_j(a_1(t), a_2(t), \ldots, a_N(t)), \quad j = 1, 2, \ldots, N, \tag{2.4}
\]
where all $f_j : \mathbb{R}^N \to \mathbb{R}$ ($1 \leq j \leq N$) are smooth and locally Lipschitz continuous. Note that $u_N(0) = P_N u_0$. Therefore

$$a_j(0) = (u_0, \cos j \pi x), \quad j = 1, 2, \cdots, N. \quad (2.5)$$

Using the theory of initial-value problems of the ordinary differential equations, there is a time $T_N > 0$ such that the initial-value problem (2.4)-(2.5) has a unique smooth solution $(a_1(t), a_2(t), \cdots, a_N(t))$ for $t \in [0, T_N]$. Therefore, there are three steps for us to prove the lemma:

Step 1. Setting $v_N = u_N$ in (2.2), we obtain

$$\frac{1}{2} \frac{d}{dt} \|u_N\|^2 + k \|u_{Nxx}\|^2 + \beta \|u_N\|^2 + \delta \|u_{Nx}\|^4 = -\gamma(u_{N}, u_{N}) - \alpha(u_{Nxx}, u_{N}).$$

Noticing that

$$-\gamma(u_{N}, u_{N}) \leq \delta \|u_{N}\|^4 + \frac{\gamma^2}{4\delta} \|u_N\|^2,$$

and

$$-\alpha(u_{Nxx}, u_{N}) \leq \frac{k}{2} \|u_{Nxx}\|^2 + \frac{\alpha^2}{2k} \|u_N\|^2.$$

Hence, by a simple calculation, we get

$$\frac{d}{dt} \|u_N\|^2 + k \|u_{Nxx}\|^2 = (\frac{\gamma^2}{4\delta} + \frac{\alpha^2}{k} - 2\beta) \|u_N\|^2. \quad (2.6)$$

Using Gronwall’s inequality, we deduce that

$$\|u_N\|^2 \leq e(\frac{\gamma^2}{4\delta} + \frac{\alpha^2}{k} - 2\beta) \|u_N(0)\|^2 \leq e(\frac{\gamma^2}{4\delta} + \frac{\alpha^2}{k} - 2\beta) T \|u_0\|^2, \quad \forall t \in [0, T]. \quad (2.7)$$

Integrating (2.6) from 0 to $T$, we obtain

$$\int_0^T \|u_{Nxx}\|^2 dt \leq \frac{1}{k} \left[ (\frac{\gamma^2}{4\delta} + \frac{\alpha^2}{k} - 2\beta) \int_0^T \|u_N\|^2 dt + \|u_N(0)\|^2 \right] \leq \frac{1}{k} \left[ (\frac{\gamma^2}{4\delta} + \frac{\alpha^2}{k} - 2\beta) e(\frac{\gamma^2}{4\delta} + \frac{\alpha^2}{k} - 2\beta) T + 1 \|u_0\|^2 \right]. \quad (2.8)$$

Step 2. Setting $v_N = -u_{Nxx}$ in (2.2), we obtain

$$\frac{1}{2} \frac{d}{dt} \|u_N\|^2 + k \|u_{Nxxx}\|^2 + \beta \|u_{Nxx}\|^2 - \gamma(u_{N}, u_{Nxx})$$

$$-\alpha \|u_{Nxxx}\|^2 + 3\delta(u_{N}, u_{Nxx}, u_{Nxxxx}) = 0. \quad (2.9)$$

Noticing that

$$\gamma(u_{N}, u_{Nxx}) = 0, \quad \delta(u_{N}, u_{Nxx}, u_{Nxxxx}) \geq 0, \quad \alpha \|u_{Nxxx}\|^2 = -\alpha(u_{N}, u_{Nxxxx}).$$

Then, we have

$$\frac{1}{2} \frac{d}{dt} \|u_N\|^2 + k \|u_{Nxxx}\|^2 + \beta \|u_{Nxx}\|^2 \leq \alpha \|u_{Nxxx}\|^2 \leq \frac{k}{2} \|u_{Nxxx}\|^2 + \frac{\alpha^2}{2k} \|u_N\|^2.$$
that is
\[
\frac{d}{dt} \|u_{Nx}\|^2 + k \|u_{Nxxxx}\|^2 \leq \left( \frac{\alpha^2}{k} - 2\beta \right) \|u_{Nx}\|^2. \tag{2.10}
\]
Using Gronwall’s inequality, we get
\[
\|u_{Nx}\|^2 \leq e^{(\frac{\alpha^2}{k} - 2\beta)t} \|u_{Nx}(0)\|^2 \leq e^{(\frac{\alpha^2}{k} - 2\beta)T} \|u_{Nx}(0)\|^2, \quad \forall t \in [0, T]. \tag{2.11}
\]
Integrating (2.10) from 0 to T, we obtain
\[
\int_0^T \|u_{Nxxxx}\|^2 dt \leq \frac{1}{k} \left( \frac{\alpha^2}{k} - 2\beta \right) e^{(\frac{\alpha^2}{k} - 2\beta)T} \|u_{Nx}(0)\|^2 + \|u_{Nx}(0)\|^2 \leq \frac{1}{k} \left( \frac{\alpha^2}{k} - 2\beta \right) e^{(\frac{\alpha^2}{k} - 2\beta)T} + 1 \|u_{Nx}(0)\|^2. \tag{2.12}
\]
Step 3. Setting \( v_N = u_{Nxxxx} \) in (2.2), we obtain
\[
\frac{1}{2} \frac{d}{dt} \|u_{Nxxxx}\|^2 + k \|u_{Nxxxx}\|^2 + \beta \|u_{Nxxxx}\|^2 + \gamma((u_{Nx})^2, u_{Nxxxx}) + \alpha(u_{Nxx}, u_{Nxxxx}) - 3\delta((u_{Nx})^2 u_{Nxxxx}, u_{Nxxxx}) = 0.
\]
By Nirenberg’s inequality, we deduce that
\[
\|u_{Nxx}\|^2 \leq c' \|u_{Nxxxx}\|^\frac{1}{2} \|u_{Nx}\|^\frac{7}{2},
\]
and
\[
\|u_{Nxxxx}\|^4 \leq c' \|u_{Nxxxx}\|^\frac{5}{2} \|u_{Nx}\|^\frac{7}{2},
\]
where \( c' \) is a positive constant dependent only on the domain. Hence,
\[
3\delta((u_{Nx})^2 u_{Nxxxx}, u_{Nxxxx}) \leq 3\delta \|u_{Nx}\|^\frac{5}{2} \|u_{Nxx}\|^{\frac{7}{2}} \leq k \|u_{Nxxxx}\|^2 + c_2,
\]
where \( c_2 \) is a positive constant depends only on \( k, \alpha, \beta, \delta, T \) and \( \|u_0\|_{H^1} \), independent of \( N \). On the other hand, we have
\[
-\gamma((u_{Nx})^2, u_{Nxxxx}) \leq k \left( \frac{3\gamma^2}{k} \right) \|u_{Nxxxx}\|^\frac{3}{2} \|u_{Nxx}\|^\frac{5}{2} \leq k \frac{3\gamma^2}{k} \|u_{Nxxxx}\|^2 + c_3,
\]
where \( c_3 \) is a positive constant depends only on \( k, \alpha, \beta, T \) and \( \|u_0\|_{H^1} \), independent of \( N \). We also have
\[
-\alpha(u_{Nxx}, u_{Nxxxx}) \leq \frac{k}{6} \|u_{Nxxxx}\|^2 + \frac{3\alpha^2}{2k} \|u_{Nxx}\|^2.
\]
Summing up, we get
\[
\frac{d}{dt} \|u_{Nxx}\|^2 + k \|u_{Nxxxx}\|^2 \leq \left( \frac{3\alpha^2}{k} - 2\beta \right) \|u_{Nxx}\|^2 + 2(c_2 + c_3). \tag{2.13}
\]
Using Gronwall’s inequality, we obtain
\[ \|u_{Nxx}\|^2 \leq e^{\left(\frac{3\alpha^2}{k} - 2\beta\right) t} \left( \|u_{Nxx}(0)\|^2 + 2(c_2 + c_3)t \right) \leq e^{\left(\frac{3\alpha^2}{k} - 2\beta\right) t} \left( c_4 \right), \quad \forall t \in [0, T], \]
where \( c_4 \) is a positive constant depends only on \( k, \alpha, \beta, \gamma, \delta, T \) and \( \|u_0\|_{H^2} \), independents of \( N \). Integrating (2.13) from 0 to \( T \), we obtain
\[ \int_0^T \|u_{Nxxxx}\|^2 \, dt \\
\leq \frac{1}{k} \left( \frac{3\alpha^2}{k} - 2\beta \right) \int_0^T \|u_{Nxx}\|^2 \, dt + 2(c_2 + c_3)T + \|u_{Nxx}(0)\|^2 \]
(2.15)
where \( c_5 \) is a positive constant depends only on \( k, \alpha, \beta, \gamma, \delta, T \) and \( \|u_0\|_{H^2} \), independents of \( N \).

Combining (2.7), (2.8), (2.11), (2.12), (2.14), (2.15) together, we get the result of Lemma 1.

Hence, we have the following theorem on the existence and uniqueness of global solution for problem (2.2).

**Theorem 2.** Let \( u_0 \in H^2_E(0, 1) \), then for any \( T > 0 \), problem (2.2) admits a unique global solution \( u_N(x, t) \), such that
\[ u_N(x, t) \in L^\infty(0, T; H^2_E(0, 1)) \cap L^2(0, T; H^4(0, 1)). \]

**Proof.** We are going to apply the Leray-Schauder fixed point theorem to complete the proof. Define the linear space
\[ X = \left\{ u_N \in L^\infty(0, T; H^2_E(0, 1)) \cap L^2(0, T; H^4(0, 1)) : u_N(0, t) = u_N(1, t) = 0, u_N(x, 0) = u_0(x) \right\}. \]
Clearly, \( X \) is a Banach space. Define the associated operator \( T \),
\[ T : X \to X, \quad u_N \mapsto w, \]
where \( w \) is determined by the following linear problem:
\[ \frac{\partial w}{\partial t} + kw_{xxxx} + \beta w + \alpha w_{xx} = -\gamma u_N^2 + \delta u_N^3, \quad x \in (0, 1), \]
\[ w_x(0, t) = w_x(1, t) = w_{xxx}(0, t) = w_{xxx}(1, t) = 0, \quad t \in (0, T), \]
\[ w(x, 0) = u_0(x). \]
Form the discussions in Lemmas 1 and by the contraction mapping principle, $T$ has a unique fixed point $u_N$, which is the desired solution of problem (1). Since the proof of the uniqueness of the solution is easy, we omit it here. Then, Theorem 2 is proved.

Now, we give the following theorem.

**Theorem 3.** Let $u_0 \in H^2(0, 1)$, $u(x, t)$ is the solution of problem (1) and $u_N(x, t)$ is the solution of semi-discrete approximation (2.2). Then, there exists a constant $c$, depends on $k$, $\alpha$, $\beta$, $\gamma$, $\delta$, $T$ and $\|u_0\|_{H^2_E}$, independent of $N$, such that

$$\|u(x, t) - u_N(x, t)\| \leq c(N^{-2} + \|u_0 - u_N(0)\|).$$

**Proof.** Denote $N \equiv u(t) - P_N u(t)$ and $e_N = P_N u(t) - u_N(t)$. It then follows from (1a) and (2.2) that

$$
(e_N, \partial_t e_N) + k(e_N_{xx}, \partial_t e_N_{xx}) + \beta(e_N, \partial_t e_N) + \gamma(u_N^2 - u_N^2_{xx}, e_N) \\
+ \alpha(e_N, \partial_t e_N_{xx}) + \delta(u_N^3 - u_N^3_{xx}, e_N) = 0, \quad \forall e_N \in S_N.
$$

(2.16)

Setting $v_N = e_N$ in (2.16), we derive that

$$
\frac{1}{2} \frac{d}{dt} \|e_N\|^2 + k \|e_N_{xx}\|^2 + \beta \|e_N\|^2 \\
= -\gamma(u_N^2 - u_N^2_{xx}, e_N) - \alpha(e_N, e_N_{xx}) - \delta(u_N^3 - u_N^3_{xx}, e_N).
$$

(2.17)

By Theorem 1, we have

$$\|u(x, t)\|_{H^2_E} \leq c(k, \alpha, \beta, \gamma, \delta, \|u_0\|_{H^2_E}).$$

Using Sobolev’s embedding theorem, we get

$$\|u(x, t)\|_{W^{1, \infty}} \leq c(k, \alpha, \beta, \gamma, \delta, \|u_0\|_{H^2}).$$

We also have

$$\|e_N\|_{L^\infty} \leq c \|e_N\|_{H^1} \leq c(\|e_N\|^2 + \|e_N_{xx}\|^2) \leq c'(\|e_N\|^2 + \|e_N_{xx}\|^2),$$

and

$$\|e_N\|_{L^\infty} \leq c \|e_N\|_{H^2_E} \leq c(\|e_N\|^2 + \|e_N_{xx}\|^2) \leq c'(\|e_N\|^2 + \|e_N_{xx}\|^2).$$

Then

$$
-\gamma(u_N^2 - u_N^2_{xx}, e_N) \\
= -\gamma((u_N + \eta_N)u_N, e_N) \\
= \gamma(e_N + \eta_N, (u_N + \eta_N)u_N + (u_{xx} + u_{xxx})e_N) \\
\leq \gamma(\|e_N\| \|e_N_{xx}\| \|u_N + \eta_N\| \|u_{xx} + u_{xxx}\| + \|\eta_N\| \|e_N\| \|u_N + \eta_N\| \|u_{xx} + u_{xxx}\| \|e_N\| \|e_N\|) \\
\leq \frac{k}{6} \|e_{Nxx}\|^2 + c_6(\|e_N\|^2 + \|\eta_N\|^2).
$$
and
\[-\delta(u_x^3 - u_{Nx}^3, e_{Nx})\]
\[= -\delta((e_{Nx} + \eta_{Nx})(u_x^2 + u_xu_{Nx} + u_{Nx}^2), e_{Nx})\]
\[= \delta(e_N + \eta_N, (u_x^2 + u_xu_{Nx} + u_{Nx}^2)e_{Nx})\]
\[\leq \delta(\|e_N\| + \|\eta_N\|, \|e_{Nx}\| \|u_x^2 + u_xu_{Nx} + u_{Nx}^2\|_{\infty}\]
\[+ \delta(\|e_N\| + \|\eta_N\|, 2u_xu_{Nx} + u_{Nx}u_{Nx} + u_{Nx}u_{Nx} + 2u_{Nx}e_{Nx})\)
\[\leq \frac{k}{6}\|e_{Nx}\|^2 + c_7(\|e_N\|^2 + \|\eta_N\|^2),\]

where $c_6$ and $c_7$ are positive constants depends only on $k, \alpha, \beta, \gamma, \delta, T$ and $\|u_0\|_{H^2}$, independents of $N$. We also have
\[\alpha(e_N, e_{Nx}) \leq \frac{k}{6}\|e_{Nx}\|^2 + \frac{3\alpha^2}{2k}\|e_N\|^2.\]

Summing up, we deduce that
\[\frac{d}{dt}\|e_N\|^2 + k\|e_{Nx}\|^2 \leq (2c_6 + 2c_7 + \frac{3\alpha^2}{k} - 2\beta)\|e_N\|^2 + (2c_6 + 2c_7)\|\eta_N\|^2.\]

Noticing that
\[\|\eta_N\|^2 \leq cN^{-4}\|u_{xx}\|^2 \leq c_8(k, \alpha, \beta, \gamma, \delta, T, \|u_0\|_{H^2})N^{-4}.\]

Therefore
\[\frac{d}{dt}\|e_N\|^2 + k\|e_{Nx}\|^2 \leq (2c_6 + 2c_7 + \frac{3\alpha^2}{k} - 2\beta)\|e_N\|^2 + c_8(2c_6 + 2c_7)N^{-4}.\]

Using Gronwall’s inequality, we complete the proof. □

3. FULLY DISCRETE SCHEME

Let $\Delta t$ be the time-step, the full-discretization spectral method for problem (1) is read as: find $u_N^j \in S_N$ ($j = 0, 1, 2, \cdots, N$) such that

\[
\begin{aligned}
\left(u_N^{j+1} - u_N^j, v_N\right) + k\left(u_N^{j+\frac{1}{2}}, v_{Nx}\right) + \beta\left(u_N^{j+\frac{1}{2}}, v_{Nx}\right) + \gamma\left(u_N^{j+\frac{1}{2}}, v_N\right) \\
+ \alpha\left(u_N^{j+\frac{1}{2}}, v_{ Nx}\right) + \delta\left(u_N^{j+\frac{1}{2}}, v_{Nx}\right) = 0, \quad \forall v_N \in S_N,
\end{aligned}
\]

with $u_N(0) = P_N u_0$, where $u_N^{j+\frac{1}{2}} = \frac{1}{2}(u_N^j + u_N^{j+1})$.

The solution $u_N^j$ has the following property:
Lemma 2. Assume that $u_0 \in H^2_E(0, 1)$. Suppose that $u^j_N$ is a solution of problem (3.1), then there exists positive constants $c_9, c_{10}$ depend only on $k, \alpha, \beta, \gamma, \delta, T$ and $\|u_0\|_{H^2_E}$, independent of $N$, such that

$$\|u^j_N\|_{H^2_E} \leq c_9, \quad \|u^j_N\|_{W^1_{E}} \leq c_{10}.$$ 

Proof. We can use the same method as Lemma 1 to prove this lemma. Since the proof is so easy, we omit it here. □

In the following, we analyze the error estimates between the numerical solution $u^j_N$ and the exact solution $u(t_j)$. According to the properties of the projection operator $P_N$, we only need to analyze the error between $P_N u(t_j)$ and $u^j_N$. Denoted by $u^j = u(t_j), e^j = P_N u^j - u^j_N$ and $\eta^j = u^j - P_N u^j$. Therefore

$$u^j - u^j_N = \eta^j + e^j.$$ 

If no confusion occurs, we denote the average of the two instant errors $e^n$ and $e^{n+1}$ by $\bar{e}^{n+\frac{1}{2}}$, where $\bar{e}^{n+\frac{1}{2}} = \frac{e^n + e^{n+1}}{2}$. On the other hand, we let $\bar{\eta}^{n+\frac{1}{2}} = \frac{\eta^n + \eta^{n+1}}{2}$.

Firstly, we give the following error estimates for the full discretization scheme.

Lemma 3 (see [3]). For the instant errors $e^{j+1}$ and $e^j$, we have

$$\|e^{j+1}\|^2 \leq \|e^j\|^2 + 2\Delta t(u_t(t_j + \frac{1}{2}) - \frac{u^{j+1}_N - u^j_N}{\Delta t}, \bar{e}^{j+\frac{1}{2}})$$

$$+ \frac{1}{320}(\Delta t)^4 \int_{t_j}^{t_{j+1}} \|u_{ttt}\|^2 dt + \Delta t \|\bar{e}^{j+\frac{1}{2}}\|^2. \tag{3.2}$$

of (1a) with $\bar{e}^{j+\frac{1}{2}}$, letting $t = t_j + \frac{1}{2}$, we obtain

$$(u^j, \bar{e}^{j+\frac{1}{2}}) + (k u^{j+\frac{1}{2}}_x, \bar{e}^{j+\frac{1}{2}}_x) + \beta(u^{j+\frac{1}{2}}, \bar{e}^{j+\frac{1}{2}})$$

$$+ \gamma((\bar{u}^{j+\frac{1}{2}})_x^2, \bar{e}^{j+\frac{1}{2}}_x) + \alpha((\bar{u}^{j+\frac{1}{2}})_x^3, \bar{e}^{j+\frac{1}{2}}_x) = 0$$

Taking $v_N = \bar{e}^{n+\frac{1}{2}}$ in (3.1), we obtain

$$(\frac{u^{j+1}_N - u^j_N}{\Delta t}, \bar{e}^{j+\frac{1}{2}}) + k(u^{j+\frac{1}{2}}_xx, \bar{e}^{j+\frac{1}{2}}_xx) + \beta(u^{j+\frac{1}{2}}_N, \bar{e}^{j+\frac{1}{2}}_N)$$

$$+ \gamma((\bar{u}^{j+\frac{1}{2}}_N)_x^2, \bar{e}^{j+\frac{1}{2}}_x) + \alpha((\bar{u}^{j+\frac{1}{2}}_N)_x^3, \bar{e}^{j+\frac{1}{2}}_x) = 0.$$
Comparing the above two equations, we get
\[
(u_t^{j+\frac{1}{2}} - u_N^j - u_N^j) \Delta t
= -k(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_{N_{xx}}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) - \beta(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_N^{j+\frac{1}{2}, j+\frac{1}{2}}) - \gamma((u_x^{j+\frac{1}{2}})^2
- (\tilde{u}_{N_{xx}}^{j+\frac{1}{2}})^2, \tilde{e}_{x}^{j+\frac{1}{2}}) - \alpha(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_N^{j+\frac{1}{2}, j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}})^2 - \delta((u_{xx}^{j+\frac{1}{2}})^3 - (\tilde{u}_{N_{xx}}^{j+\frac{1}{2}})^3, \tilde{e}_{xx}^{j+\frac{1}{2}}).
\]

Now, we investigate the error estimates of the five items in the right-hand side of previous equation.

**Lemma 4.** Assume that \(u_0 \in H^2(0, 1)\), \(u\) is the solution for problem (1) and \(u_N^j\) is the solution for problem (3.1). Then
\[
- k(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_{N_{xx}}^{j+\frac{1}{2}, j+\frac{1}{2}}) \leq -\frac{k}{2} \|e_{xx}^{j+\frac{1}{2}}\|^2 + \frac{k(\Delta t)^3}{192} \int_{t_j}^{t_{j+1}} \|u_{xx\tau}\|^2 dt.
\]

**Proof.** Using Taylor’s expansion, we obtain
\[
\begin{align*}
u^j &= u^{j+\frac{1}{2}} - \frac{\Delta t}{2} u_t^{j+\frac{1}{2}} + \int_{t_j}^{t_{j+\frac{1}{2}}} (t - t_j) u_{tt} dt, \\
u^{j+1} &= u^{j+\frac{1}{2}} + \frac{\Delta t}{2} u_t^{j+\frac{1}{2}} + \int_{t_j}^{t_{j+1}} (t_j - t) u_{tt} dt.
\end{align*}
\]
Hence
\[
\frac{1}{2}(u^j + u^{j+1}) - u^{j+\frac{1}{2}} = \frac{1}{2} \left( \int_{t_j}^{t_{j+\frac{1}{2}}} (t - t_j) u_{tt} dt + \int_{t_j}^{t_{j+1}} (t_j - t) u_{tt} dt \right).
\]

By Hölder’s inequality, we have
\[
\|u_{xx}^{j+\frac{1}{2}} - \frac{1}{2}(u_{xx}^j + u_{xx}^{j+1})\|^2
\leq \frac{1}{4} \left( \| \int_{t_j}^{t_{j+\frac{1}{2}}} (t - t_j) u_{tt} dt + \int_{t_j}^{t_{j+1}} (t_j - t) u_{tt} dt \|^2 \right)
\leq \frac{(\Delta t)^3}{96} \int_{t_j}^{t_{j+1}} \|u_{xx\tau}\|^2 dt.
\]
Noticing that \((\tilde{\eta}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) = 0\). Therefore
\[-(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) = -(u_{xx}^{j+\frac{1}{2}} - \frac{u_{xx}^{j+1} + u_{xx}^{j}}{2}, \frac{\tilde{u}_{xx}^{j+1} + \tilde{u}_{xx}^{j}}{2} - (\tilde{u}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) \]
\[\leq \|u_{xx}^{j+\frac{1}{2}} - \frac{u_{xx}^{j+1} + u_{xx}^{j}}{2}\| \|\tilde{e}_{xx}^{j+\frac{1}{2}}\| - (\tilde{u}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) - \|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2.\]
\[\leq \left(\frac{(\Delta t)^3}{96}\right) \int_{t_j}^{t_{j+1}} \|u_{xxtt}\|^2 dt \|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2 - (\tilde{u}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) - \|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2.\]
Then, Lemma 4 is proved.

**Lemma 5.** Assume that \(u_0 \in H^2_E(0, 1)\), \(u\) is the solution for problem (1) and \(u^N\) is the solution for problem (3.1). Then
\[-\beta(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) - \alpha(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) \leq \frac{k}{6}\|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2 + \frac{3\alpha^2}{k}\|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2 + c_{11}N^{-4},\]
where \(c_{11}\) is a positive constant depends only on \(k, \alpha, \beta, \gamma, \delta, T\) and \(\|u_0\|_{H^2_E}\), independent of \(N\).

**Proof.** Noticing that
\[\|\tilde{\eta}_{xx}^{j+\frac{1}{2}}\| \leq c(k, \alpha, \beta, \gamma, \delta, T, \|u_0\|_{H^2_E})N^{-2}.\]
Hence
\[-\beta(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) - \alpha(u_{xx}^{j+\frac{1}{2}} - \tilde{u}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) \leq -\beta(\tilde{\eta}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) - \alpha(\tilde{e}_{xx}^{j+\frac{1}{2}}, \tilde{e}_{xx}^{j+\frac{1}{2}}) \leq -\alpha\|\tilde{e}_{xx}^{j+\frac{1}{2}}\| \|\tilde{e}_{xx}^{j+\frac{1}{2}}\| - \beta\|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2 \leq \frac{k}{6}\|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2 + \frac{3\alpha^2}{k}(\|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2 + \|\tilde{\eta}_{xx}^{j+\frac{1}{2}}\|^2) + \frac{\beta}{4}\|\tilde{\eta}_{xx}^{j+\frac{1}{2}}\|^2 \leq \frac{k}{6}\|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2 + \frac{3\alpha^2}{k}\|\tilde{e}_{xx}^{j+\frac{1}{2}}\|^2 + c_{11}N^{-4}.\]
Then, Lemma 5 is proved.
Lemma 6. Assume that \( u_0 \in H^2_E(0, 1) \), \( u \) is the solution to problem (1) and \( \dot{u}_N^j \) is the solution to problem (3.1). Then

\[
-\gamma((u_x^{j+\frac{1}{2}})^2 - (\ddot{u}_N^{xj+\frac{1}{2}})^2, \bar{e}^{j+\frac{1}{2}}) \\
\leq \frac{k}{6}\|\bar{e}_{xx}^{j+\frac{1}{2}}\|^2 + c_{12}\left(\frac{(\Delta t)^3}{96}\int_{t_j}^{t_{j+1}} \|u_{xxt}\|^2 \, dt + \|\bar{e}^{j+\frac{1}{2}}\|^2 + N^{-4}\right),
\]

where \( c_{12} \) is a positive constant depends only on \( k, \alpha, \beta, \gamma, \delta, T \) and \( \|u_0\|_{H^2_E} \), independent of \( N \).

Proof. Noticing that

\[
\|\bar{e}^{j+\frac{1}{2}}\| \leq c(k, \alpha, \beta, \gamma, \delta, T, \|u_0\|_{H^2_E})N^{-2}.
\]

Hence, using the integration by parts, we have

\[
-\gamma((u_x^{j+\frac{1}{2}})^2 - (\ddot{u}_N^{xj+\frac{1}{2}})^2, \bar{e}^{j+\frac{1}{2}}) \\
= -\gamma((u_x^{j+\frac{1}{2}})^2 - (\ddot{u}_N^{xj+\frac{1}{2}})^2, \bar{e}^{j+\frac{1}{2}}) - \gamma((\ddot{u}_N^{xj+\frac{1}{2}})^2 - (\ddot{u}_N^{xj+\frac{1}{2}})^2, \bar{e}^{j+\frac{1}{2}}) \\
= -\gamma((u_x^{j+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}})(u_x^{j+\frac{1}{2}} - \ddot{u}_N^{xj+\frac{1}{2}}), \bar{e}^{j+\frac{1}{2}}) \\
- \gamma((\ddot{u}_N^{xj+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}})(\ddot{u}_N^{xj+\frac{1}{2}} - \ddot{u}_N^{xj+\frac{1}{2}}), \bar{e}^{j+\frac{1}{2}}) \\
= -\gamma((u_x^{j+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}})(u_x^{j+\frac{1}{2}} - \ddot{u}_N^{xj+\frac{1}{2}}), \bar{e}^{j+\frac{1}{2}}) \\
+ \gamma\left(\bar{e}^{j+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}}, (u_x^{j+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}})\bar{e}^{j+\frac{1}{2}} + (u_x^{j+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}})\ddot{u}_N^{xj+\frac{1}{2}}\right).
\]

By Hölder’s inequality and Sobolev’s embedding theorem, we get

\[
\gamma((u_x^{j+\frac{1}{2}})^2 - (\ddot{u}_N^{xj+\frac{1}{2}})^2, \bar{e}^{j+\frac{1}{2}}) \\
\leq \gamma\|u_x^{j+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}}\|_\infty \|u_x^{j+\frac{1}{2}} - \ddot{u}_N^{xj+\frac{1}{2}}\| \|\bar{e}^{j+\frac{1}{2}}\| \\
+ \gamma(\|\ddot{e}^{j+\frac{1}{2}}\| + \|\ddot{\eta}^{j+\frac{1}{2}}\|)\|u_x^{j+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}}\| \|\bar{e}^{j+\frac{1}{2}}\|_{\infty} \\
+ \gamma(\|\ddot{e}^{j+\frac{1}{2}}\| + \|\ddot{\eta}^{j+\frac{1}{2}}\|)\|u_x^{j+\frac{1}{2}} + \ddot{u}_N^{xj+\frac{1}{2}}\|_{\infty} \|\bar{e}^{j+\frac{1}{2}}\| \\
\leq c_\gamma\left(\frac{(\Delta t)^3}{96}\int_{t_j}^{t_{j+1}} \|u_{xxt}\|^2 \, dt\right)^{\frac{1}{2}} \|\bar{e}^{j+\frac{1}{2}}\| + c_\gamma(\|\ddot{e}^{j+\frac{1}{2}}\| + \|\ddot{\eta}^{j+\frac{1}{2}}\|) \|\bar{e}^{j+\frac{1}{2}}\| \\
\leq \frac{k}{6}\|\bar{e}_{xx}^{j+\frac{1}{2}}\|^2 + c_{12}\left(\frac{(\Delta t)^3}{96}\int_{t_j}^{t_{j+1}} \|u_{xxt}\|^2 \, dt + \|\bar{e}^{j+\frac{1}{2}}\|^2 + N^{-4}\right).
\]
Hence, Lemma 6 is proved.

\[\square\]

**Lemma 7.** Assume that \( u_0 \in H^2_E(0, 1) \), \( u \) is the solution for problem (1) and \( u^N \) is the solution for problem (3.1). Then

\[
-\delta ((u_x^{j+\frac{1}{2}})^3 - (u^N_{xx})^3, \tilde{\varepsilon}_x^{j+\frac{1}{2}}) \\
\leq \frac{k}{6} \|\tilde{\varepsilon}_x^{j+\frac{1}{2}}\|^2 + c_{13} \left( \frac{(\Delta t)^3}{96} \int_{t_j}^{t_{j+1}} \|u_{xtt}\|^2 dt + \|\tilde{\varepsilon}_x^{j+\frac{1}{2}}\|^2 + N^{-4} \right),
\]

where \( c_{13} \) is a positive constant depends only on \( k, \alpha, \beta, \gamma, \delta, T \) and \( \|u_0\|_{H^2_E} \), independent of \( N \).

**Proof.** Noticing that

\[
\|\tilde{\eta}^{j+\frac{1}{2}}\| \leq c(k, \alpha, \beta, \gamma, \delta, T, \|u_0\|_{H^2_E}) N^{-2}.
\]

Hence, using the integration by parts, we have

\[
-\delta ((u_x^{j+\frac{1}{2}})^3 - (u^N_{xx})^3, \tilde{\varepsilon}_x^{j+\frac{1}{2}}) \\
= -\delta ((u_x^{j+\frac{1}{2}})^3 - (u^N_{xx})^3, \tilde{\varepsilon}_x^{j+\frac{1}{2}}) + \delta ((\tilde{\varepsilon}_x^{j+\frac{1}{2}})^3 - (u^N_{xx})^3, \tilde{\varepsilon}_x^{j+\frac{1}{2}}) \\
= -\delta \left( (u_x^{j+\frac{1}{2}} + \tilde{u}_x^{j+\frac{1}{2}})((u_x^{j+\frac{1}{2}})^2 + (\tilde{u}_x^{j+\frac{1}{2}})^2 + (\tilde{\varepsilon}_x^{j+\frac{1}{2}})^2), \tilde{\varepsilon}_x^{j+\frac{1}{2}} \right) \\
+ \delta \left( \tilde{u}_x^{j+\frac{1}{2}} - (u_x^{j+\frac{1}{2}} + \tilde{u}_x^{j+\frac{1}{2}})((u_x^{j+\frac{1}{2}})^2 + (\tilde{u}_x^{j+\frac{1}{2}})^2 + (\tilde{\varepsilon}_x^{j+\frac{1}{2}})^2), \tilde{\varepsilon}_x^{j+\frac{1}{2}} \right) \\
+ \delta \left( u_x^{j+\frac{1}{2}} - u_x^N((u_x^{j+\frac{1}{2}})^2 + (\tilde{u}_x^{j+\frac{1}{2}})^2 + (\tilde{\varepsilon}_x^{j+\frac{1}{2}})^2), \tilde{\varepsilon}_x^{j+\frac{1}{2}} \right).
\]

By Hölder’s inequality and Sobolev’s embedding theorem, we immediately obtain
where dependent of small, there exists positive constants Assume further that
satisfying
Then, Lemma 7 is proved.

Then, Lemma 7 is proved.

Thus, we obtain the following theorem.

**Theorem 4.** Assume that \( u_0 \in H^2_E(0, 1) \), \( u(x,t) \) is the solution for problem (1) satisfying

\[
 u \in L^\infty(0, T; H^2_E(0, 1)), \quad u_{tt} \in L^2(0, T; H^2_E(0, 1)), \quad u_{ttt} \in L^2(0, T; L^2(0, 1)).
\]

Assume further that \( u^j_N \) is the solution for problem (3.1). Then, if \( \Delta t \) is sufficiently small, there exists positive constants \( c_{14} \) depends on \( k, \alpha, \beta, \gamma, \delta, T, \| u_0 \|_{H^2}, \) independent of \( N \), and \( c_{15} \) depends on \( k, \alpha, \beta, \gamma, \delta, T, \| u_0 \|_{H^2}, \int_0^T \| u_{ttt} \|^2 dt \), \( \int_0^T \| u_{tt} \|^2 dt \), independent of \( N \), such that, for \( j = 0, 1, 2, \cdots, N \),

\[
\| e^{j+1} \| \leq c_{14}(N^{-2} + \| e^0 \|) + c_{15}(\Delta t)^2.
\]

**Proof.** By Lemmas 3-7, we obtain

\[
\| e^{j+1} \|^2 \leq \| e^j \|^2 + \Delta t c_{16}(\| e^{j+1} \|^2 + \| e^j \|^2 + N^{-4}) + (\Delta t)^4 c_{17} \int_{t_j}^{t_{j+1}} \left( \| u_{tt} \|^2 + \| u_{ttt} \|^2 + \| u_{ttt} \|^2 \right) dt,
\]

where \( c_{16} \) and \( c_{17} \) are positive constants depend only on \( k, a, b, T \) and \( \| u_0 \|_{H^2} \). For \( \Delta t \) being sufficiently small, such that \( c_{17} \Delta t \leq \frac{1}{2} \), setting \( c_{18} = 2(c_{16} + c_{17}) \), we get

\[
\| e^{j+1} \|^2 \leq (1 + c_{18} \Delta t)\| e^j \|^2 + c_{18}(\Delta t N^{-4} + (\Delta t)^4 B^j),
\]
where

\[
B^j = \int_{t_j}^{t_{j+1}} \left( \| u_{ttt} \|^2 + \| u_{ttt} \|^2 + \| u_{ttt} \|^2 \right) dt.
\]
Using Gronwall’s inequality for the discrete form, we have
\[ \|e^{j+1}\|^2 \leq e^{C_1(j+1)} \left( \|e^0\|^2 + C_1 \left( j \Delta t N^{-4} + (\Delta t)^4 \sum_{i=0}^{j} B^i \right) \right). \]

Directly computation shows that
\[ \sum_{i=0}^{j} B^i \leq \int_0^{t+1} (\|u_{tt}\|^2 + \|u_{xxt}\|^2 + \|u_{ttt}\|^2) dt. \]

Thus, Theorem 4 is proved. \(\square\)

Furthermore, we have the following theorem.

**Theorem 5.** Assume that \(u_0 \in H^2_E(0,1)\), \(u(x,t)\) is the solution for problem (1) satisfying \(u \in L^\infty(0,T;H^2_E(0,1)), u_{ttt} \in L^2(0,T;L^2(0,1))\).

Assume further that \(u^j_N \in S_N\) \((j = 0, 1, 2, \ldots)\) is the solution for problem (3.1) and the initial value \(u^0_N\) satisfies
\[ \|e^0\| = \|P_N u_0 - u^0_N\| \leq c N^{-2} \|u_{xx}\|. \]

Then, there exists positive constants \(c'\) depends on \(k, \alpha, \beta, \gamma, \delta, \theta,\) \(\|u_0\|_{H^2},\) independent of \(N,\) and \(c''\) depends on \(k, \alpha, \beta, \gamma, \delta, \theta,\) \(\|u_0\|_{H^2},\) \(\int_0^T ||u_{ttt}||_{L^2}^2 dt, \int_0^T ||u_{ttt}||^2 dt,\) independent of \(N,\) such that
\[ \|u(x,t_j) - u^j_N\| \leq c' N^{-2} + c'' (\Delta t)^2, \quad j = 0, 1, 2, \ldots, N. \]

4. Numerical result

In this section, using the Fourier spectral method described in (3.1), we carry out some numerical computations to illustrate our results in previous section. The full-discretization spectral method is read as: For \(v_l = \sin l \pi x,\) \(l = 1, \ldots, N,\) find
\[ u^0_N = \sum_{l=0}^{N} a_l^0 \cos l \pi x. \]

such that (3.1) hold.

As an example, we choose \(k = 1, \beta = 2, \gamma = 1, \alpha = 1, \delta = 1, u_0 = (1 - x)^4 x^4 + 0.001,\) \(\Delta t = 0.001/2, 0.001/4,\) \(N = 32,\) and get the solution which evolves from \(t = 0\) to \(t = 0.1\) (cf. Figure 1).

Now, we consider the variation of error. Since no exact solution to problem (1) is known for us, we make a comparison between the solution of (3.1) on a coarse mesh and on a fine mesh.
We choose $\Delta t = 0.001, 0.001 \times \frac{1}{2}, 0.001 \times \frac{1}{4}, 0.001 \times \frac{1}{8}, 0.001 \times \frac{1}{16}$, respectively to solve (3.1). Set $u_{N}^{\min}(x, 0.1)$ as the solution for $\Delta t_{\min} = 0.001 \times \frac{1}{32}$. Denote

$$
err(0.1, \Delta t) = \left( \int_{0}^{1} \left( u_{N}^{k}(x, 0.1) - u_{N}^{\min}(x, 0.1) \right)^{2} \, dx \right)^{\frac{1}{2}}, k = 1, 2, \ldots, 6. \tag{4.1}
$$

Then the error is showed in the Table 1 at $t = 0.1$.

<table>
<thead>
<tr>
<th>$\Delta t$</th>
<th>$err(0.1, \Delta t)$</th>
<th>$\frac{err(0.1, \Delta t)}{(\Delta t)^{2}}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.001</td>
<td>2.3691 $\times 10^{-6}$</td>
<td>2.3691</td>
</tr>
<tr>
<td>$0.001 \times \frac{1}{2}$</td>
<td>3.7397 $\times 10^{-7}$</td>
<td>1.4959</td>
</tr>
<tr>
<td>$0.001 \times \frac{1}{4}$</td>
<td>5.6875 $\times 10^{-8}$</td>
<td>0.9100</td>
</tr>
<tr>
<td>$0.001 \times \frac{1}{8}$</td>
<td>8.4589 $\times 10^{-9}$</td>
<td>0.5413</td>
</tr>
<tr>
<td>$0.001 \times \frac{1}{16}$</td>
<td>1.0349 $\times 10^{-9}$</td>
<td>0.1035</td>
</tr>
</tbody>
</table>

In Table 1, it is easy to see that the third column $\frac{err(0.1, \Delta t)}{(\Delta t)^{2}}$ is monotone decreasing along with the time step’s waning. Hence, we can find a positive constant $C = 2.3691$, such that

$$
\frac{err(0.1, \Delta t)}{(\Delta t)^{2}} \leq C, \quad k = 1, 2, \ldots, 5,
$$
which means the order of error estimates is $O((\Delta t)^2)$ proved in Theorem 5.

On the other hand, Choose $N = 32, 40, 48, 56$, $\Delta t_0 = 0.001 \times \frac{1}{32}$, respectively to solve (3.1).

<table>
<thead>
<tr>
<th>$N$</th>
<th>$err(0.1, \Delta t_0)$</th>
<th>$\frac{err(0.1, \Delta t_0)}{N^{-2}}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>32</td>
<td>$1.8637 \times 10^{-10}$</td>
<td>$1.908 \times 10^{-7}$</td>
</tr>
<tr>
<td>40</td>
<td>$1.4862 \times 10^{-10}$</td>
<td>$2.378 \times 10^{-7}$</td>
</tr>
<tr>
<td>48</td>
<td>$8.6941 \times 10^{-11}$</td>
<td>$2.003 \times 10^{-7}$</td>
</tr>
<tr>
<td>56</td>
<td>$4.1655 \times 10^{-11}$</td>
<td>$1.306 \times 10^{-7}$</td>
</tr>
</tbody>
</table>

Then the error is showed in Table 2 at $t = 0.1$. In Table 2, it is easy to see that the third column $\frac{err(0.1, \Delta t_0)}{(N)^{-2}}$ is almost monotone decreasing along with the time step’s waning. Hence, we can find a positive constant $C = 2.378 \times 10^{-7}$, such that

$$\frac{err(0.1, \Delta t)}{(\Delta t)^2} \leq C, \quad N = 32, 40, 48, 56,$$

which means the order of error estimates is $O(N^{-2})$ proved in Theorem 5.

5. Conclusions

Since the tools we have used work for the periodic boundary values, this result is also valid for the 1D Kolmogorov-Spiegel-Sivashinsky equation with the periodic boundary conditions. That is, for any $u_0 \in H^2_{per}(0, 1)$, choose the finite dimensional subspace of $H^2_{per}(0, 1)$:

$$S_N = \text{span}\{e^{ikx}; -N/2 \leq k \leq N/2\},$$

the existence, uniqueness and optimal error bounds for semi-discrete and fully discrete schemes can also be proved under the periodic boundary conditions

$$\partial^j u(0, t) = \partial^j u(1, t), \quad t > 0, \ j = 0, 1, 2, 3.$$

Since the original Kolmogorov-Spiegel-Sivashinsky (KSS) equation which arises in physical systems such as the Kolmogorov flow (a turbulent system of small-scale eddies supported by external energy sources) and the large-scale structure of compressible non-Boussinesqian convection (large scale turbulent solar convection) is formulated in $\mathbb{R}^n$. Here, we only consider the 1D case of the equation. If we want to understand the properties of this model better, we should study the numerical solutions for the multi-dimensional KSS equation, which is our intention in the future.
ACKNOWLEDGEMENTS

The authors would like to express their deep thanks to the referee’s valuable suggestions for the revision and improvement of the manuscript.
